

TeamSync

Turns scattered conversations into shared work

INTERNAL PRODUCT CONCEPT · CORE WORKFLOW & ARCHITECTURE

Made with GAMMA

THE STATUS TRAP

Teams lose time translating conversation into status

01

Buried commitments

Decisions and deliverables stay trapped inside busy chat threads and unreviewed meeting notes.

02

Repeated updates

Team members spend hours re-typing progress across standups, group channels, and tracking sheets.

03

Context chasing

Managers hunt down source discussions before they can spot critical blockers or rebalance workload.

Made with GAMMA

One approved task, visible wherever authorized work happens

TeamSync proposes tasks, owners, deadlines, and updates from enabled group conversations.

Approved records appear in the group tracker and responsible team dashboard.

Updates flow through one shared task record, not separate copies.

Made with GAMMA

LIFECYCLE & FLOW

The product story is conversation → confirmation → visibility

A single task record travels through each stage with clear human governance.

01

Discuss

Teams collaborate naturally where work already happens in chat.

02

Confirm

Authorized team members review, edit, or reject proposed actions.

03

Track

Shared task views deliver synchronized progress across all teams.

04

Manage

Stakeholders inspect blockers without reopening private discussion threads.

Made with GAMMA

PRIVACY BOUNDARIES

Private-chat capture keeps the source private

“Jot this down”

Emma selects specific messages in a private 1:1 chat and triggers capture explicitly.

Audience verification

She inspects the generated task fields and selects the target destination before confirming.

Strict chat isolation

Only the approved task payload is published; task visibility never exposes the underlying private conversation.

Made with GAMMA

ROLE-TAILORED SURFACES

Shared views make work legible without exposing conversations

Group tracker

Overview, tasks, pending approvals, and recent updates.

Team dashboard

Owners, statuses, deadlines, blockers, and cross-project commitments.

Catch-up context

Helps returning members without summarizing inaccessible chats.

Note: Task volume metrics represent committed work items, not total organizational capacity.

Made with GAMMA

GOVERNANCE & OVERSIGHT

Human approval is the control point

AI proposes, but authorized people verify every system action.

01

Triaged actions

Suggestions can be approved, edited, rejected, or routed back to the assistant for clarification.

02

Ambiguity gates

Unspecified owners, ambiguous deadlines, or missing statuses must be resolved before committing.

03

Freshness checks

Outdated proposals require explicit re-confirmation; stale AI updates are never executed automatically.

Made with GAMMA

ACCESS CONTROL

Permissions travel with the task

Role / Boundary	Task Access	Edit Scope	Source Chat Visibility
Viewer	Read-only	None	Governed by chat membership
Editor	Read & comment	Scoped to assigned boundary	Governed by chat membership
Cross-functional PM	Full visibility	Delegated edit across teams	Governed by chat membership
Source Chats	Independent	Thread participants only	Strict zero-leakage boundary

Permissions evaluate on each task record independently; granting task access never grants read access to source discussions.

Made with GAMMA

DATA INTEGRITY

Consistency depends on one record and a visible audit trail

SYNCHRONIZATION

Atomic state propagation

Edits propagate instantly across channel trackers, private panels, and executive dashboards from a single primary record.

LINEAGE

Full immutable audit

Every approval, assigned editor, timestamp, and field delta is preserved in an append-only event stream.

RESILIENCE

Idempotent sync

Network or webhook failures remain transparently logged and retryable without risking duplicate task creation.

100%

Traceability across all task lifecycle mutations

Made with GAMMA

ARCHITECTURE & STACK

The technical shape favors traceability over magic

APPLICATION

React + TypeScript client

A single FastAPI service and PostgreSQL datastore.

EVENT LOG

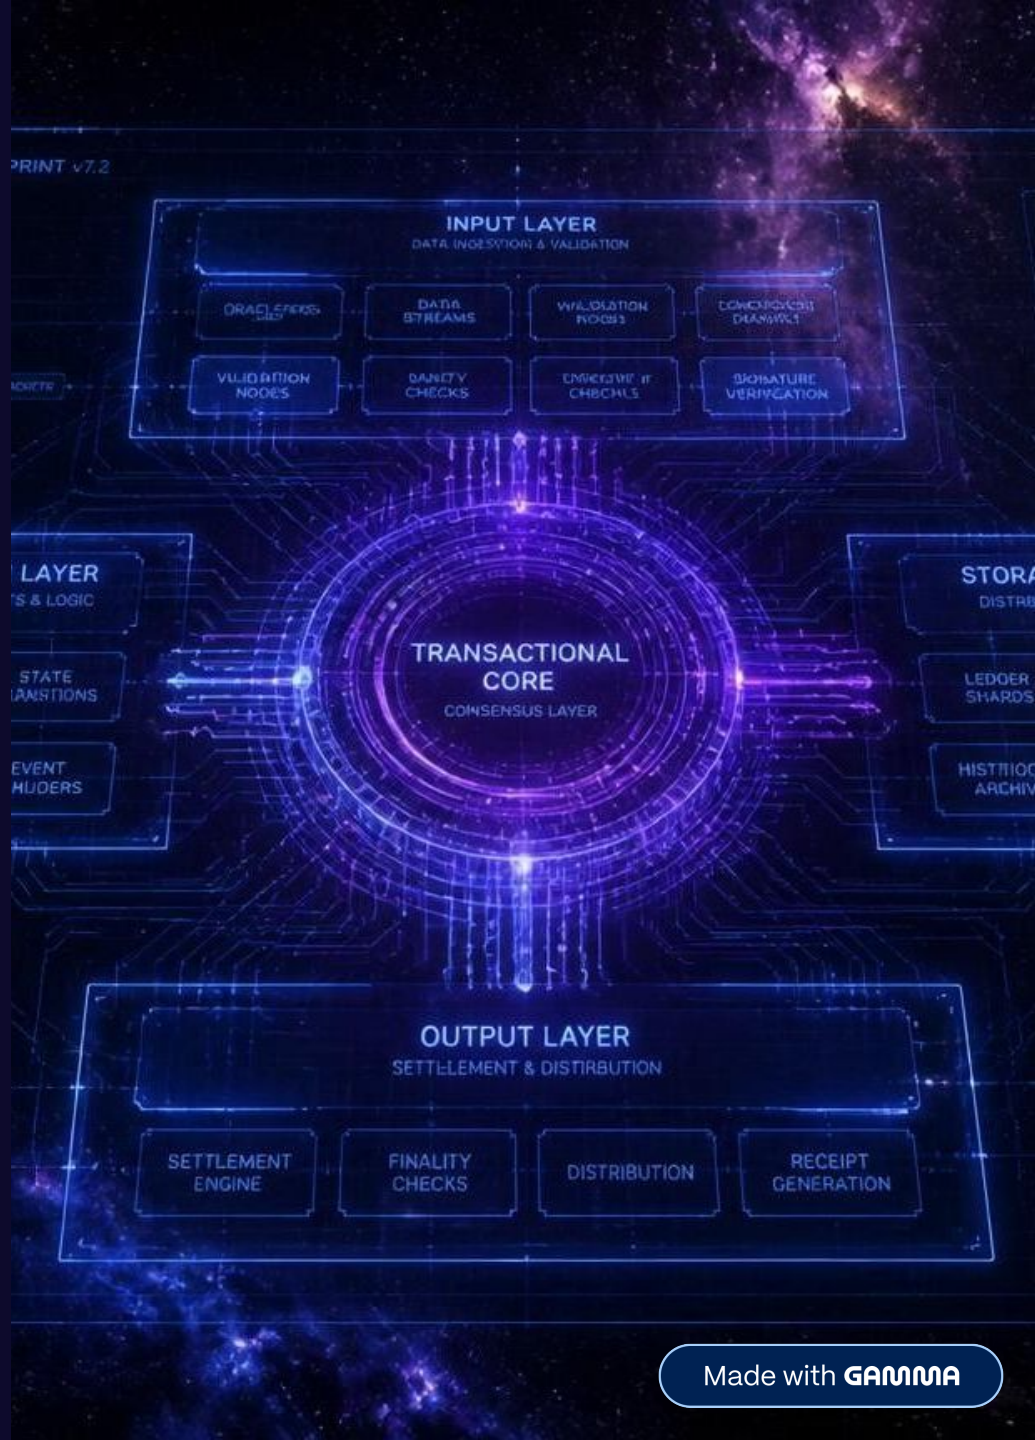

One transaction

Every change writes an event row in the same transaction.

APPROVAL BOUNDARY

AI worker proposes; a person accepts

Actions go through scoped, schema-validated tools.
